

OPEN GOVERNANCE STANDARD (DRAFT)

Governance as redesignable
civilisational infrastructure

A Governance 3.0-ready
open framework that
sits underneath

- institution
- technology
- people

Three

First Principles

Many of Us Overlook

First, **Governance acts through rules.**

Rules are the smallest durable governance units through which institutions encode permissions, constraints, obligations, and consequences.

Three

First Principles

Many of Us Overlook

Second, **Rules are humanity's earliest automation technology.**

Long before digital systems, societies used rules to *pre-structure behaviour and decisions* at scale.

Three First Principles Many of Us Overlook

Third, **AI extends that layer rather than replacing it.**

If modern automation is built on weak rule systems, failure is mechanised rather than removed.

Modern automation is only as good as the rule systems beneath it.

WHY

This work exists

Problem

- Governance **often stops at values, principles, and local tools** without a coherent way to translate them into rules, tasks, controls, and accountable execution.

WHY

This work exists

Implication

- Institutions can state accountability, transparency, neutrality, and integrity clearly while still **lacking the structure to make those properties real** in live systems.

WHY

This work exists

Response

- 
- Open Governance Standard (OGS) is a **modular governance stack** for integrating:
 - rule change
 - shared governance language
 - reasoning task governance
 - fail-safe AI orchestration

From Governance Principles To Operational Architecture

**This is a
governance stack**
not a single tool

**This is
operational
architecture**
not another values-
only framework

OGS layer stack

Using the OS analogy

Rule Debt Compounds Under **Acceleration**

Governance debt builds when institutions cannot
update, interpret, implement, and retire rules at the speed change demands.

The issue is metabolic capacity
not only rule quality.

*When governance cannot keep up, systems
remain formally governed but
practically misaligned.*

Rule Debt Compounds Under Acceleration

Governance fails not only when
rules are wrong, but when rule systems
cannot adapt fast enough.

Open Meta- Governance Standard

A set of **rules** for
rule change and implementation

This standard is about how a
rule system should:

govern
itself

&

govern
reality

*OMGS makes rule systems
more explicit, inspectable, and adaptable
under accelerating change.*

Open Meta- Governance Standard

Ideally, through rules, **institutions** respond to external changes in the way **individuals** do through feedback, understanding, decision and action.

Changes in the
external environment

OMGS
helps rule
administration
align to this first-
principle understanding.

C O M M O N G O V E R N A N C E L A N G U A G E

A **shared governance grammar** for
different rule environments,
with nine core modules including:

Cross-sector
enforcement
typology

Human
activities
logic

Institutional
architecture
definitions

“code-as-rule” language
“rule-as-code” outcome

*An alternative language that doesn't
compress human governance logic
into computer coding.*

C O M M O N G O V E R N A N C E L A N G U A G E

To enable **interoperability** and
reduce translation loss across
governance functions
and sectors

Horizontally

across sectors
such as

- social services
- infrastructure
- foreign affairs

Vertically

across

- Law
- Policy
- Procedure

TASK BOUNDARY FRAMEWORK

All governance operations are
powered by reasoning.

Understanding reasoning at
atomic level is what makes
governance AI governable.

*Governance starts with making work
meaningfully visible.*

TASK BOUNDARY FRAMEWORK

Understanding where reasoning sits, what kind of judgement is involved, what information is being handled, and where **decision authority must remain human**.

Structured data
vs
Unstructured data

Data input
vs
Data output

“Why” reasoning
“How” reasoning
“What” reasoning

Suitable for human
vs
Suitable for machine

Institutions can use TBF to **systematically define** automation boundaries, human review points, and future work redesign more explicitly.

Project **W**hite **C**ollar

*An AI orchestration design that incorporates
Interoperability with human governance*

Diversity of perspectives

through distinct reasoning roles, not duplicated operators.

Separation of powers

so those roles do not collapse into one executive path.

Committee-style oversight

so consequential decisions remain governable and reviewable.

*PWC reuses institutional design from well-governed
human organisations.*

Project White Collar

Three Principles behind all
well-governed human organisations

Project White Collar

Text-based LLM is an
AI technology that **automates
unstructured data operations:**

Human
language
information

Documented
Knowledge

Interaction
between
people

*As such, AI orchestration
is best governed by
unstructured data rules.*

How the OGS layers work together

Four Ground Insights

Design commitments beneath OGS

Governance fails less from lack of values than from **lack of operational structure.**

Governance should **optimise for long-term stewardship**, not short-term execution speed.

Four Ground Insights

Design commitments beneath OGS

Rule quality is not enough; **rule metabolism** determines whether governance can **keep up with change**.

AI governance must remain **interoperable with human governance**.

AI operates in unstructured reasoning environments where conventional digital rules do not apply natively.

OPEN GOVERNANCE STANDARD (DRAFT)

Join the groundwork of building the next-gen civilisation infrastructure

The goal is to **operationalise**:

- Accountability
- Transparency
- Neutrality
- Integrity

Appendix

Deeper materials for each layer

This deck is a compact overview of the stack.
